

Whether standard model or
complex special design – with the
Klaes panel door manufacturing
everything goes!

Klaes Panel Door Manufacturing

With the new Klaes panel door manufacturing all the DOORS will be open for you in the future. Create individual wooden front doors as easy as never before and do it directly in your Klaes Construction-Program. Select either a pre-defined model and adjust it to your wishes or freely design your front door surfaces with the Klaes CAD Program.

In a very high display quality you can individually select and process cuts, fitting- and accessory articles on the inside as well as on the outside. Depending on the selected model, the machining parameters given by the manufacturer automatically change. You can directly see which processings are possible and can be made. In addition, the system is connected with the fitting master data so that changes referring to the fitting, such as the changing of the backset, can directly be updated.

In case of a short-term order change, all measures and settings will be adjusted appropriately to the respective construction. Thus, a subsequent change of the locating face can be made at the click of a button and without any elaborate manual post-processing. In addition, the list print gives you an overview of all used manufacturing articles and materials. And in the calculation, the elements can be calculated with the corresponding production times.

- Free choice of pre-defined standard models
- Subsequent changes at the click of a button at any time
- Connection between fitting master data and surface processing
- Clear list print with manufacturing information
- Automatically generated DXF-data for machine control
- All current calculation methods are selectable
